5600 Iron Filter Servicing Instructions

Service to be done every 3-6 months. If you need further information, call Metro Water Filter of the South.

Preliminary Notes

- ☞ This operation should take about 3-5 minutes.
- ☞ You'll need a container of Potassium, rubber gloves, and something to stir the Potassium with.
- ☞ Potassium will stain your hands and anything it comes into contact with. Wear rubber gloves.

Step 1 Remove the black lid on the Brine Barrel.

Step 2 If there's a second lid on the small canister inside the Brine Barrel, remove this lid.

You can throw this lid away as it's not really needed.

Step 3 | If there's any Potassium inside the small canister, you will need to thoroughly stir it. Make sure you stir it all the way to the bottom.

Some times the Potassium in the bottom will dissolve, leaving a hollow cavity with Potassium on the top. In this case, the cavity must be thoroughly broken up.

Step 4 | Pour new Potassium into the small canister until it's at least half full.

Avoid breathing the Potassium powder.

Step 5 | Replace the black lid back onto the Brine Barrel.

Step 6 | Check and adjust the time clock on the filter as necessary.

That's it. You're done.

- Should you run into trouble while servicing your filter, call us for assistance. We have an answering service and are available 24 hours a day, 7 days a week.
